Website Screenshot Explanations

A separate explanation of each of the three website designs

Image 1: Explore India Website

This webpage is a tourism and heritage website called **Explore India**. Its purpose is to introduce visitors to famous Indian destinations, cultural festivals, traditional foods, and useful travel advice.

Section-by-section explanation

Header and introduction: The top section displays the website title and a short message welcoming visitors to explore India's beauty, culture, and heritage.

Famous destinations: Three destination cards feature the Taj Mahal, Charminar, and Hampi. Each card includes an image, the region, and a short description.

Cultural festivals: Cards for Diwali, Holi, and Bathukamma introduce popular Indian festivals and briefly describe how they are celebrated.

Famous Indian food: The food section presents Hyderabad Biryani, Idli and Dosa, and Chole Bhature with pictures and short descriptions.

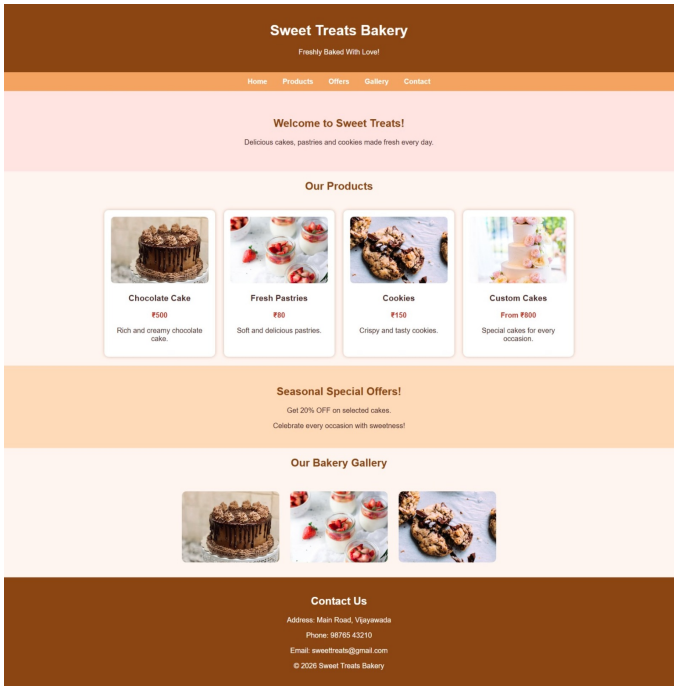

Travel tips: A numbered list recommends carrying identification and travel documents, checking the weather, respecting local traditions, keeping heritage sites clean, and booking in advance.

Image gallery and footer: The gallery displays a scenic landscape image. The footer identifies the site as an India tourism and heritage website.

Key design and coding concepts: HTML/CSS concepts shown: headings, paragraphs, images, grouped cards, ordered lists, background colours, borders, rounded corners, spacing, and a footer.

Image 2: Sweet Treats Bakery Website

This webpage is a bakery website called **Sweet Treats Bakery**. It presents bakery products, prices, special offers, product photographs, and contact information.

Section-by-section explanation

Header and navigation bar: The header shows the bakery name and the tagline “Freshly Baked With Love!”. The navigation links lead to sections such as Home, Products, Offers, Gallery, and Contact.

Welcome section: A short introduction tells visitors that cakes, pastries, and cookies are made fresh every day.

Our products: Four product cards show Chocolate Cake, Fresh Pastries, Cookies, and Custom Cakes. Each card includes a photograph, price, and brief description.

Seasonal special offers: This section advertises a 20% discount on selected cakes and encourages customers to celebrate occasions with bakery treats.

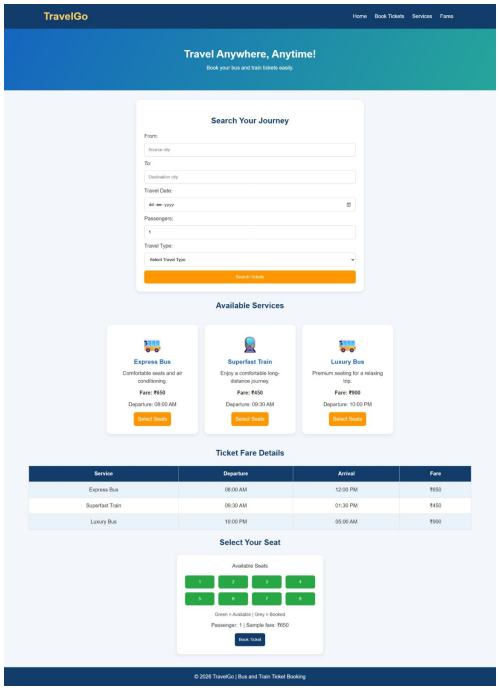

Bakery gallery: A row of photographs displays some of the bakery products in a gallery layout.

Contact section: The bottom section provides a sample address, phone number, email address, and copyright line.

Key design and coding concepts: HTML/CSS concepts shown: navigation links, product cards, images, headings, price text, section backgrounds, shadows, rounded corners, alignment, and contact details.

Image 3: TravelGo Bus and Train Booking Website

This webpage is a travel booking interface called **TravelGo**. It is designed to help users search for bus or train journeys, compare services and fares, select seats, and book a ticket.

Section-by-section explanation

Header and navigation: The top navigation contains links such as Home, Book Tickets, Services, and Fares.

Hero section: A coloured banner displays “Travel Anywhere, Anytime!” and explains that users can book bus and train tickets.

Search your journey form: The form contains fields for source city, destination city, travel date, number of passengers, and travel type. A Search Tickets button submits the search form.

Available services: Three service cards show Express Bus, Superfast Train, and Luxury Bus, along with icons, fares, departure times, and Select Seats buttons.

Ticket fare details: A table compares each service by departure time, arrival time, and fare. This helps users compare the available options.

Select your seat: A seat-selection panel displays eight numbered seats in green, a legend explaining seat status, passenger information, a sample fare, and a Book Ticket button.

Footer: The footer shows the year, website name, and the bus and train ticket booking description.

Key design and coding concepts: HTML/CSS concepts shown: forms, labels, input fields, a date field, a dropdown, buttons, service cards, tables, seat grids, colour indicators, shadows, and page layout. A working booking system would also need programming and a backend; the screenshot alone does not confirm that bookings are processed.
